

# Relational Algebra

---

EGCI321: LECTURE06 (WEEK 3)

# Relational Database

---

# Relational Algebra

---

The relational algebra consists of a set of *operator*

- Each operator takes one or more input relations
- Relational operators can be composed of form expressions that define new relations in terms of existing relations.

*Notation:*

*R* is a relation name;

*E* is a relational algebra expression

# Primary Relational Operators

---

Relation Name:  $R$

Selection:  $\sigma_{condition}(E)$

- Result schema is the same as  $E$ 's
- Result instance includes the subset of the tuples of  $E$  that each satisfies the condition

Projection:  $\pi_{attributes}(E)$

- Result schema includes only the specified attributes
- Result instance could have as many tuples as  $E$ , except that duplicates are eliminated

# Primary Relational Operators (cont.)

---

Rename:  $\rho(R(\bar{F}), E)$

- $\bar{F}$  is a list of terms of the form *oldname*  $\rightarrow$  *newname*
- Returns the result of  $E$  with columns renamed according to  $\bar{F}$
- Remembers the result as  $R$  for future expressions

Product:  $E_1 \times E_2$

- Result schema has all of the attributes of  $E_1$  and all of the attributes of  $E_2$
- Result instance includes one tuple for every pair of tuples (one from each expression result) in  $E_1$  and  $E_2$
- Sometimes called *cross-product* or *Cartesian product*
- Renaming is needed when  $E_1$  and  $E_2$  have common attributes

# Cross Product Example

---

$R$

| $AAA$ | $BBB$ |
|-------|-------|
| $a_1$ | $b_1$ |
| $a_2$ | $b_2$ |
| $a_3$ | $b_3$ |

$S$

| $CCC$ | $DDD$ |
|-------|-------|
| $c_1$ | $d_1$ |
| $c_2$ | $d_2$ |

$R \times S$

| $AAA$ | $BBB$ | $CCC$ | $DDD$ |
|-------|-------|-------|-------|
| $a_1$ | $b_1$ | $c_1$ | $d_1$ |
| $a_2$ | $b_2$ | $c_1$ | $d_1$ |
| $a_3$ | $b_3$ | $c_1$ | $d_1$ |
| $a_1$ | $b_1$ | $c_2$ | $d_2$ |
| $a_2$ | $b_2$ | $c_2$ | $d_2$ |
| $a_3$ | $b_3$ | $c_2$ | $d_2$ |

# Select, Project, Product Examples

---

Note: Use *Emp* to mean the Employee relation, *Proj* the project relation

Find the last names and hire date of employees who make more than \$100000

$$\pi_{\text{LastName, HireDate}}(\sigma_{\text{Salary} > 100000}(\text{Emp}))$$

For each project for which department *E<sub>21</sub>* is responsible, find the name of the employee in charge of that project.

$$\pi_{\text{ProjNo, LastName}}(\sigma_{\text{DeptNo} = E_{21}}(\sigma_{\text{RespEmp} = \text{EmpNo}}(\text{Emp} \times \text{Proj})))$$

# Joins

---

Conditional Join:  $E_1 \bowtie_{condition} E_2$

- Equivalent to  $\sigma_{condition}(E_1 \times E_2)$
- Special case *equijoin*

$$Proj \bowtie_{(RespEmp=EmpNo)} E$$

Natural join ( $E_1 \bowtie E_2$ )

- The result of ( $E_1 \bowtie E_2$ ) can be formed by the following steps
  1. Form the cross-product *E1* and *E2*
  2. Eliminate from the cross product any tuples that do not have matching value for *all pairs* of attributes common to schemas *E1* and *E2*
  3. Project out duplicate attributes
- If no attributes in common, this is just a product

# Example:

S

| S# | SNAME | STATUS | CITY   |
|----|-------|--------|--------|
| S1 | Smith | 20     | London |
| S2 | Jones | 10     | Paris  |
| S3 | Blake | 30     | Paris  |
| S4 | Clark | 20     | London |
| S5 | Adams | 30     | Athens |

P

| P# | PNAME | COLOR | WEIGHT | CITY   |
|----|-------|-------|--------|--------|
| P1 | Nut   | Red   | 12.0   | London |
| P2 | Bolt  | Green | 17.0   | Paris  |
| P3 | Screw | Blue  | 17.0   | Rome   |
| P4 | Screw | Red   | 14.0   | London |
| P5 | Cam   | Blue  | 12.0   | Paris  |
| P6 | Cog   | Red   | 19.0   | London |

Natural-join

| S# | SNAME | STATUS | CITY   | P# | PNAME | COLOR | WEIGHT |
|----|-------|--------|--------|----|-------|-------|--------|
| S1 | Smith | 20     | London | P1 | Nut   | Red   | 12.0   |
| S1 | Smith | 20     | London | P4 | Screw | Red   | 14.0   |
| S1 | Smith | 20     | London | P6 | Cog   | Red   | 19.0   |
| S2 | Jones | 10     | Paris  | P2 | Bolt  | Green | 17.0   |
| S2 | Jones | 10     | Paris  | P5 | Cam   | Blue  | 12.0   |
| S3 | Blake | 30     | Paris  | P2 | Bolt  | Green | 17.0   |
| S3 | Blake | 30     | Paris  | P5 | Cam   | Blue  | 12.0   |
| S4 | Clark | 20     | London | P1 | Nut   | Red   | 12.0   |
| S4 | Clark | 20     | London | P4 | Screw | Red   | 14.0   |
| S4 | Clark | 20     | London | P6 | Cog   | Red   | 19.0   |

# Example: Natural Join

---

Consider the natural join of the Project and Department tables, which have attribute **DeptNo** in common

- The schema of the result will include attributes **ProjName**, **DeptNo**, **ResEmp**, **MajProj**, **DeptName**, **MgrNo**, and **AdmrDept**
- The resulting relation will include one tuple for each tuple in the Project relation

# Set-Based Relational Operators

---

## Union ( $R \cup S$ ):

- Schemas of  $R$  and  $S$  must be “union compatible”
- Result includes all tuples that appear either in  $R$  or in  $S$  or in both

## Difference ( $R - S$ )

- Schemas of  $R$  and  $S$  must be “union compatible”
- Result includes all tuples that appear in  $R$  and that do not appear in  $S$

## Intersection ( $R \cap S$ ): same type

- Schemas of  $R$  and  $S$  must be “union compatible”
- Result includes all tuples that appear in both  $R$  and  $S$

## Union Compatible:

- Same number of fields
- ‘Corresponding’ fields have the same type

# Relational Division

---

| $X$   |       |       |
|-------|-------|-------|
| $A$   | $B$   | $C$   |
| $a_1$ | $b_1$ | $c_1$ |
| $a_1$ | $b_1$ | $c_2$ |
| $a_1$ | $b_2$ | $c_2$ |
| $a_2$ | $b_1$ | $c_1$ |
| $a_2$ | $b_1$ | $c_2$ |
| $a_2$ | $b_2$ | $c_2$ |
| $a_2$ | $b_3$ | $c_3$ |
| $a_3$ | $b_1$ | $c_1$ |

| $S$   |       |
|-------|-------|
| $B$   | $C$   |
| $b_1$ | $c_1$ |
| $b_1$ | $c_2$ |
| $b_2$ | $c_2$ |

| $X/S$ |  |
|-------|--|
| $A$   |  |
| $a_1$ |  |
| $a_2$ |  |

# Division is the Inverse of Product

---

|       |  |
|-------|--|
| $R$   |  |
| $A$   |  |
| $a_1$ |  |
| $a_2$ |  |

|       |       |
|-------|-------|
| $S$   |       |
| $B$   | $C$   |
| $b_1$ | $c_1$ |
| $b_1$ | $c_2$ |
| $b_2$ | $c_2$ |

|              |       |       |
|--------------|-------|-------|
| $R \times S$ |       |       |
| $A$          | $B$   | $C$   |
| $a_1$        | $b_1$ | $c_1$ |
| $a_1$        | $b_1$ | $c_2$ |
| $a_1$        | $b_2$ | $c_2$ |
| $a_2$        | $b_1$ | $c_1$ |
| $a_2$        | $b_1$ | $c_2$ |
| $a_2$        | $b_2$ | $c_2$ |

|                  |  |
|------------------|--|
| $(R \times S)/S$ |  |
| $A$              |  |
| $a_1$            |  |
| $a_2$            |  |

# Summary of Relational Operators

---

$$\begin{array}{lcl} E & ::= & R \\ & | & \sigma_{condition}(E) \\ & | & \pi_{attributes}(E) \\ & | & \rho(R(\overline{F}), E) \\ & | & E_1 \times E_2 \\ & | & E_1 \bowtie_{condition} E_2 \\ & | & E_1 \bowtie E_2 \\ & | & E_1 \cup E_2 \\ & | & E_1 \cap E_2 \\ & | & E_1 - E_2 \\ & | & E_1 / E_2 \end{array}$$

# Algebraic Equivalences

---

This

$$\pi_{ProjNo, LastName} \left( \sigma_{DeptNo=E21} \left( \sigma_{RespEmp=EmpNo} (E \times P) \right) \right)$$

Equivalent to this:

$$\pi_{ProjNo, LastName} \left( \sigma_{DeptNo=E21} (E \bowtie_{RespEmp=EmpNo} P) \right)$$

Equivalent to this:

$$\pi_{ProjNo, LastName} (E \bowtie_{RespEmp=EmpNo} \sigma_{DeptNo=E21} (P))$$

Equivalent to this:

$$\pi_{ProjNo, LastName} \left( \left( \pi_{LastName, EmpNo} (E) \right) \bowtie_{RespEmp=EmpNo} \left( \pi_{ProjNo, RespEmp} \left( \sigma_{DeptNo=E21} (P) \right) \right) \right)$$

# Example I: Instances (Sailors and Reserve)

---

|           |            |            |            |
|-----------|------------|------------|------------|
| <i>R1</i> | <u>sid</u> | <u>bid</u> | <u>day</u> |
|           | 22         | 101        | 10/10/96   |
|           | 58         | 103        | 11/12/96   |

|           |            |        |        |      |
|-----------|------------|--------|--------|------|
| <i>s1</i> | <u>sid</u> | sname  | rating | age  |
|           | 22         | dustin | 7      | 45.0 |
|           | 31         | lubber | 8      | 55.5 |
|           | 58         | rusty  | 10     | 35.0 |

|           |            |        |        |      |
|-----------|------------|--------|--------|------|
| <i>s2</i> | <u>sid</u> | sname  | rating | age  |
|           | 28         | yuppy  | 9      | 35.0 |
|           | 31         | lubber | 8      | 55.5 |
|           | 44         | guppy  | 5      | 35.0 |
|           | 58         | rusty  | 10     | 35.0 |

# Example I: Projection

- Deletes attributes that are not in projection list.
- Schema of result contains exactly the fields in the projection list, with the same names that they had in the (only) input relation.
- Projection operator has to eliminate duplicates!
  - ▶ Note: real systems typically don't do duplicate elimination unless the user explicitly asks for it.

| sname  | rating |
|--------|--------|
| yuppy  | 9      |
| lubber | 8      |
| guppy  | 5      |
| rusty  | 10     |

$\pi_{sname, rating}(S2)$

| age  |
|------|
| 35.0 |
| 55.5 |

$\pi_{age}(S2)$

# Example I: Selection

- Selects rows that satisfy selection condition.
- No duplicates in result!
- Schema of result identical to schema of (only) input relation.
- Result relation can be the input for another relational algebra operation! (Operator composition.)

| sid | sname | rating | age  |
|-----|-------|--------|------|
| 28  | yuppy | 9      | 35.0 |
| 58  | rusty | 10     | 35.0 |

$$\sigma_{rating > 8}(S2)$$

| sname | rating |
|-------|--------|
| yuppy | 9      |
| rusty | 10     |

$$\pi_{sname, rating}(\sigma_{rating > 8}(S2))$$

# Example I: Union, Intersection, and Set-Difference

All of these operations take two input relations, which must be union-compatible:

- Same number of fields.
- 'Corresponding' fields have the same type.

| sid | sname  | rating | age  |
|-----|--------|--------|------|
| 22  | dustin | 7      | 45.0 |
| 31  | lubber | 8      | 55.5 |
| 58  | rusty  | 10     | 35.0 |
| 44  | guppy  | 5      | 35.0 |
| 28  | yuppy  | 9      | 35.0 |

$S1 \cup S2$

| sid | sname  | rating | age  |
|-----|--------|--------|------|
| 22  | dustin | 7      | 45.0 |

$S1 - S2$

| sid | sname  | rating | age  |
|-----|--------|--------|------|
| 31  | lubber | 8      | 55.5 |
| 58  | rusty  | 10     | 35.0 |

$S1 \cap S2$

# Example I: Cross Product

- Each row of S1 is paired with each row of R1.
- Result schema has one field per field of S1 and R1, with field names 'inherited' if possible.
  - ▶ Conflict: Both S1 and R1 have a field called sid.

| (sid) | sname  | rating | age  | (sid) | bid | day      |
|-------|--------|--------|------|-------|-----|----------|
| 22    | dustin | 7      | 45.0 | 22    | 101 | 10/10/96 |
| 22    | dustin | 7      | 45.0 | 58    | 103 | 11/12/96 |
| 31    | lubber | 8      | 55.5 | 22    | 101 | 10/10/96 |
| 31    | lubber | 8      | 55.5 | 58    | 103 | 11/12/96 |
| 58    | rusty  | 10     | 35.0 | 22    | 101 | 10/10/96 |
| 58    | rusty  | 10     | 35.0 | 58    | 103 | 11/12/96 |

*Renaming operator:*

$$\rho (C(1 \rightarrow sid1, 5 \rightarrow sid2), S1 \times R1)$$

# Practice: Write the Relational Algebra

---

## List of Tables

- Flights(flno, from, to, distance, departs)
- Aircraft(aid, aname, range)
- Certified(eid, aid)
- Employees(eid, ename, salary)

## Query Statement

1. Find eid's of pilots who are certified on "Boeing777".  
(Boeing777 is aid)
2. Find eid of employee(s) with the salary > 100,000.\
3. Find employee's name and aircraft's name who are certified on "Airbus 600"  
(Airbus 600 is aid)

# Reference
